Oslo Enhanced Hackathon 2026

Program and rules

Practical Information

- Join the slack
- Questions? Ask your contact person or in the generativKI slack-channel #oslo-enhanced-hackathon-2026
- Technical information details are shared in #oslo-enhanced-hackathon-2026, incl. access to AWS-models
  - FAQ canvas in the slack channel
  - We use our token-budget until it is empty
  - We share links to dashboards for token usage, test completion etc.
- Let's have fun!

Challenge Overview

- Build a Translation Tool (TT) that converts TypeScript to Python
- Case: Translate ghostfolio, a financial portfolio management system
- Time: 3 hours of coding (15:30 - 18:30)
- Judged by: correctness, code quality and understanding
- No LLMs for translation - but you can use them to build the TT!
- First time we do this competition, so judging is best effort!
- Sponsored by AWS, giving us a bunch of Bedrock credits

Solution Submission

- Set your main branch to your final commit at 18:30
- Must include:
  - Runnable implementation of TT
  - SOLUTION.md explaining your approach
  - Can include visualizations
- Present your solution to judges
- 3 finalists present 3m each from stage, after 18.30

knowit

Judges

Judging Criteria (1/2)

Ask questions at the end of this presentation

- 1. Rule Compliance
  - Must follow all competition rules
- 2. Correctness (85%)
  - Translated Python passes official API test suite
  - Number of tests passed matters
- 3. Python Code Quality (15%)
  - Readability
  - Maintainability
  - Mixed static and human evaluation of quality
- 4. Best engineering under constraints
  - Very short time for assignment
  - We expect a prototype, not perfect code

Judging Criteria (2/2)

- 4. Understanding
  - Can you explain what your TT does?
- 5. Completion Time
  - Tie breaker if two teams solved same number of tests
- Scoring: tests + code quality + judge review
  - The tests are weighted internally, so more challenging tests weigh more than simpler tests

Core Rules (1/2)

knowit

- 0. Make a python tool TT which
  - Can translate ghostfolio from TypeScript to Python
  - The translated version should pass as many of the API tests as possible

  1. You may use the API tests to verify correctness of the translated code.

  2. TT must not have project-specific logic which it simply copies into the translation. The translated code must be actually translated code, not pregenerated logic.

  3. You may use AST (abstract syntax trees) libraries in Python.

Core Rules (2/2)

knowit

4. Your Python code may not call node/js-tools or other external tools to translate the code. The translation should happen in Python.
5. The judges will have a one week period to detect cheating or other rule breaches. This might change the final winner.
6. We expect the git commit log to reflect a gradual development of the solution, so do frequent commits

See COMPETITION_RULES.md in the repo we will share for more details.

Judging Process & Timeline

- 15:15-15:30: Instructions & briefing
- 15:30-18:30: Coding time
  - GitHub access provided at 15:30
  - 17:30-18:30: Coding + judge visits
    - 3-minute explanation to judges
    - Keep coding during this time!
- 18:30: ALL CODING STOPS - commit to main
- 18:30-19:00: Judges select 3 finalists
- 19:10-19:20: Finalist presentations
- 19:30: Winner announced! 🏆

Prizes & Awards

- 🥇 Winning team: 30.000 NOK
- 🥈 2nd place: 7.500 NOK
- 🥉 3rd place: 5.000 NOK
- 🚀 Most innovative workflow/agent setup: 2.500 NOK
- 🤝 Best team cooperation: 2.500 NOK
- ⭐ Special jury award: 2.500 NOK

- Gift cards mailed after one week

Solution Layout

- translations/ghostfolio_pytx/app/
- ├── wrapper/ (provided by original repo)
- │ └── implementation/ (TT-generated)

- You only modify implementation directory!

Workflow Suggestion

1. Generate translator TT with claude code etc
2. Run `make evaluate_tt_ghostfolio`
3. Publish results with `make publish_results`
4. Verify test performance and investigate possible rule breaches
5. Inspect code manually?
6. Iterate on translator

Setup

1. Join the slack space if you haven't yet
    1. Send PM to Pål de Vibe to join channel #oslo-enhanced-hackathon-2026
2. Fork https://github.com/knowit-enhanced-coding-comp/hackathon-tt-py
3. Give **knowit-enhanced-coding-comp** read access to your fork
4. Add token usage snippet to .claude config so we can visualize your token usage

GenerativKI-slack

Automated Rule Checks

- An imperfect tool to help you solve the solution correctly
- Run: make detect_rule_breaches
- Green checks does not mean you aren't cheating

- Checks enforce:
  - ✓ No LLM usage in TT
  - ✓ No project-specific mappings in TT
  - ✓ No pre-translated logic inside TT
  - ✓ Wrapper not modified
  - ...
